Arslan Haider
Application Name: Instagram
Instagram is a social media application in which you can share media and chat with others.

Task 1:
- A common use of Instagram is messaging your friends it can be a text or any media you're sharing in the chat.
- From the home screen within the app you slide to the left of the screen and that's where all your messages will be and you can click on whoever you wanna message and then just text him or share whatever you want. Or at the top of the home screen there is a message button that you can click
- Sometimes while attempting to text your friend you can run into a problem where your message may not go through or it double sends the text. Also like if you're sharing a picture sometimes it doesn't go through and it just fails, the picture wouldn't be a direct picture that goes into the chat but more like a viewable snap.

Task 2:
- You are attempting to post something to your story to share with your followers.
- A story is basically a mass media that you could share to your following it can consist of pictures or videos. You can post by sliding to the right from the home screen or by clicking the plus button at the top of the home screen. There are many options and features you can add to your story as in your location or a tag. All the editing options are shown on instagram where you can post your story from.
- Sometime you may run into the problem of that while posting onto your story the quality of your picture or video gets dropped.

Task 3:
- You are scrolling through your feed and exploring content.
- On your home screen you can scroll down and see what has been shared recently by the people you follow like their pictures or videos, you can either like them or comment on them or just scroll past them. Also, you can click the search emblem at the bottom of Instagram and go on the explorer page and see the relevant content shown to you.
- A common problem while scrolling through your feed is that is stops loading or just lags. If you're attempting to share something from your explore page, it sometimes doesn't send and load within the chat.
